

Teamspeak 3 with lots of noise

Posted by LHY - 14 Jun 2012 12:11

Hello,

I believe installed AVS correctly. I can hear the voice modded in the duplex.

On Teamspeak, it is set to use the Avnex. To some extent I can hear my voice.

But there is a very, very loud hissing noise. Like being inside a turbine. It echoes and, each time it echoes, it gets louder until it silences.

Completely unable to hear my voice.

Hi LHY,

Please check your Inbox for our response.

Thanks.

Hello,

I'm still having issues.

It keeps echoing.

Can you please be very specific with the mute and configs in the sound setup? There are multiple volumes for different things... The microphone input, microphone output, AVNEX output, built-in sound output...

Actually, it's not with Teamspeak. It's AVC itself.

I turned on the "listen to" on the AVNEX, and the echo was there.

I don't know what else to do.

Hi,

Please try as following to fix the problem:

In Windows Sound settings :

1. Windows desktop » Start menu » Settings » Control panel » Click on Hardware and Sound.
2. Click on Sound to go to the Audio Devices manager
3. Switch to the Recording tab, change the Sound Recording Default device back to normal.
4. Click OK to apply the new settings and close the Sound dialog box.

Hello,

On my Recording Tab I have three currently active:

Avnex Virtual Audio Device

100 volume

I see the green bar moving constantly with the AVC on. It is cycling.

Realtek High Definition Audio

100 volume

+20 DB

The green bar only moves if I speak loudly or close to the mic

Stereo mix

Disabled.
