

Sound Quality Problems

Posted by DXT - 22 Jan 2014 09:55

I'm having some problems. When I first load up the software (AV Voice Changer Diamond 8), the quality of my changed voice is great. The longer the software runs, however, the worse the quality seems to get. After about 10-15 minutes or so, the quality goes from being perfectly clear to having a bit of a buzzing/underwater effect. After a few hours, the voice cuts in and out as I speak so badly that my voice is not even understandable.

I've tried a fresh reinstall a few times. I've also tried deactivating my anti-virus and firewall. The problem persists even after.

Any help for this issue is appreciated.
The software is working great for the most part besides this problem.

Hi DXT,

Thank you for your feedback.

Regarding the sound problem, please tell us which kind of your headset. You're using a desktop or laptop?

Hi Gabriella.

For some reason my posts aren't showing up, so I apologize for the long wait. Hopefully this one will show up. I'm using a Steelseries 3HVR headset and a desktop computer with Windows 7 Ultimate.

I just read a review of VCS 8 where someone said their sound quality was decreasing with each new task Windows opened and they were using Windows 7 as well. Maybe that's the issue for me too? I also had this problem with VCS 7.
